ABSTRACT

This study involves the simulation of a synesthesia-like experience for non-synesthetes, to enhance the learning of a musical skill. The goal of this project is to validate whether a synesthesia-like experience could positively influence the acquisition of musical talent. The idea is to increase the number of associations made to a chord (a harmonic group of notes). In this work, chord-color mappings are manifested using colored visuals displayed while listening to music. The expected outcome is that students who learn using consistent chord-color associations will perform better when tested on the identification of chords.

INTRODUCTION

Synesthesia is a condition of the human mind where seemingly unrelated senses are experienced simultaneously [1]. An example of this is seeing color when you hear sound or seeing written words and numbers in color. The current data shows that 2% of the population has some degree of this condition, with a larger concentration in artistic communities. This suggests that there is a correlation between creative skill and sensory experience. Synesthetes have a biological advantage which makes them more receptive to early exploration and adoption thus translating into more expertise in adulthood.

REFERENCES FORMAT

Your references should be published materials accessible to the public. Internal technical reports may be cited only if they

Permission to make digital or hard copies of all or part of this work for personal or classroom use is granted without fee provided that copies are not made or distributed for profit or commercial advantage and that copies bear this notice and the full citation on the first page. Copyrights for components of this work owned by others than the author(s) must be honored. Abstracting with credit is permitted. are easily accessible and may be obtained by any reader for a nominal fee. Proprietary information may not be cited. Private communications should be acknowledged in the main text, not referenced (e.g., [Golovchinsky, personal communication]). References must be the same font size as other body text. References should be in alphabetical order by last name of first author. Use a numbered list of references at the end of the article, ordered alphabetically by last name of first author, and referenced by numbers in brackets. For papers from conference proceedings, include the title of the paper and the name of the conference. Do not include the location of the conference or the exact date; do include the page numbers if available.

References should be in ACM citation format: http://www.acm.org/publications/submissions/latex_style. This includes citations to Internet resources [4, 3, 9] according to ACM format, although it is often appropriate to include URLs directly in the text, as above. Example reference formatting for individual journal articles [2], articles in conference proceedings [7], books [10], theses [11], book chapters [12], an entire journal issue [6], websites [1, 3], tweets [4], patents [5], games [8], and online videos [9] is given here. See the examples of citations at the end of this document and in the accompanying BibTeX document. This formatting is a edited version of the format automatically generated by the ACM Digital Library (<http://dl.acm.org>) as “ACM Ref.” DOI and/or URL links are optional but encouraged as are full first names. Note that the Hyperlink style used throughout this document uses blue links; however, URLs in the references section may optionally appear in black.
